

Playing sound.

How sound works.

Figure 1

Sound wave properties.

Sound frequency.

hertz (Hz) = 1 cycle per second.

220 Hz

440 Hz

880 Hz

Complex waveforms.

Modulating frequency.

Hello

How digital sound works.

Digital sampling.

Sampling quality.

Sample rate and bits per sample.

Sample rate.

How many discrete samples per second (measured in Hz).

Bits per sample.

Sound quality and bits.

Audio waveform

Waveform sampled
at 22 bits.

Waveform sampled
at 16 bits.

Waveform sampled
at 8 bits.

Bitrate.

Bitrate.

Sampling rate combined with bit depth.

Reflects the total bit count processed per second.

Measured in bits per second or bit/s (or bps)

Playing digital audio.

Playing **digital sound** involves **filling an audio buffer** with **audio data** on demand.

Playing audio with SDL2

SDL_mixer (the easy way).

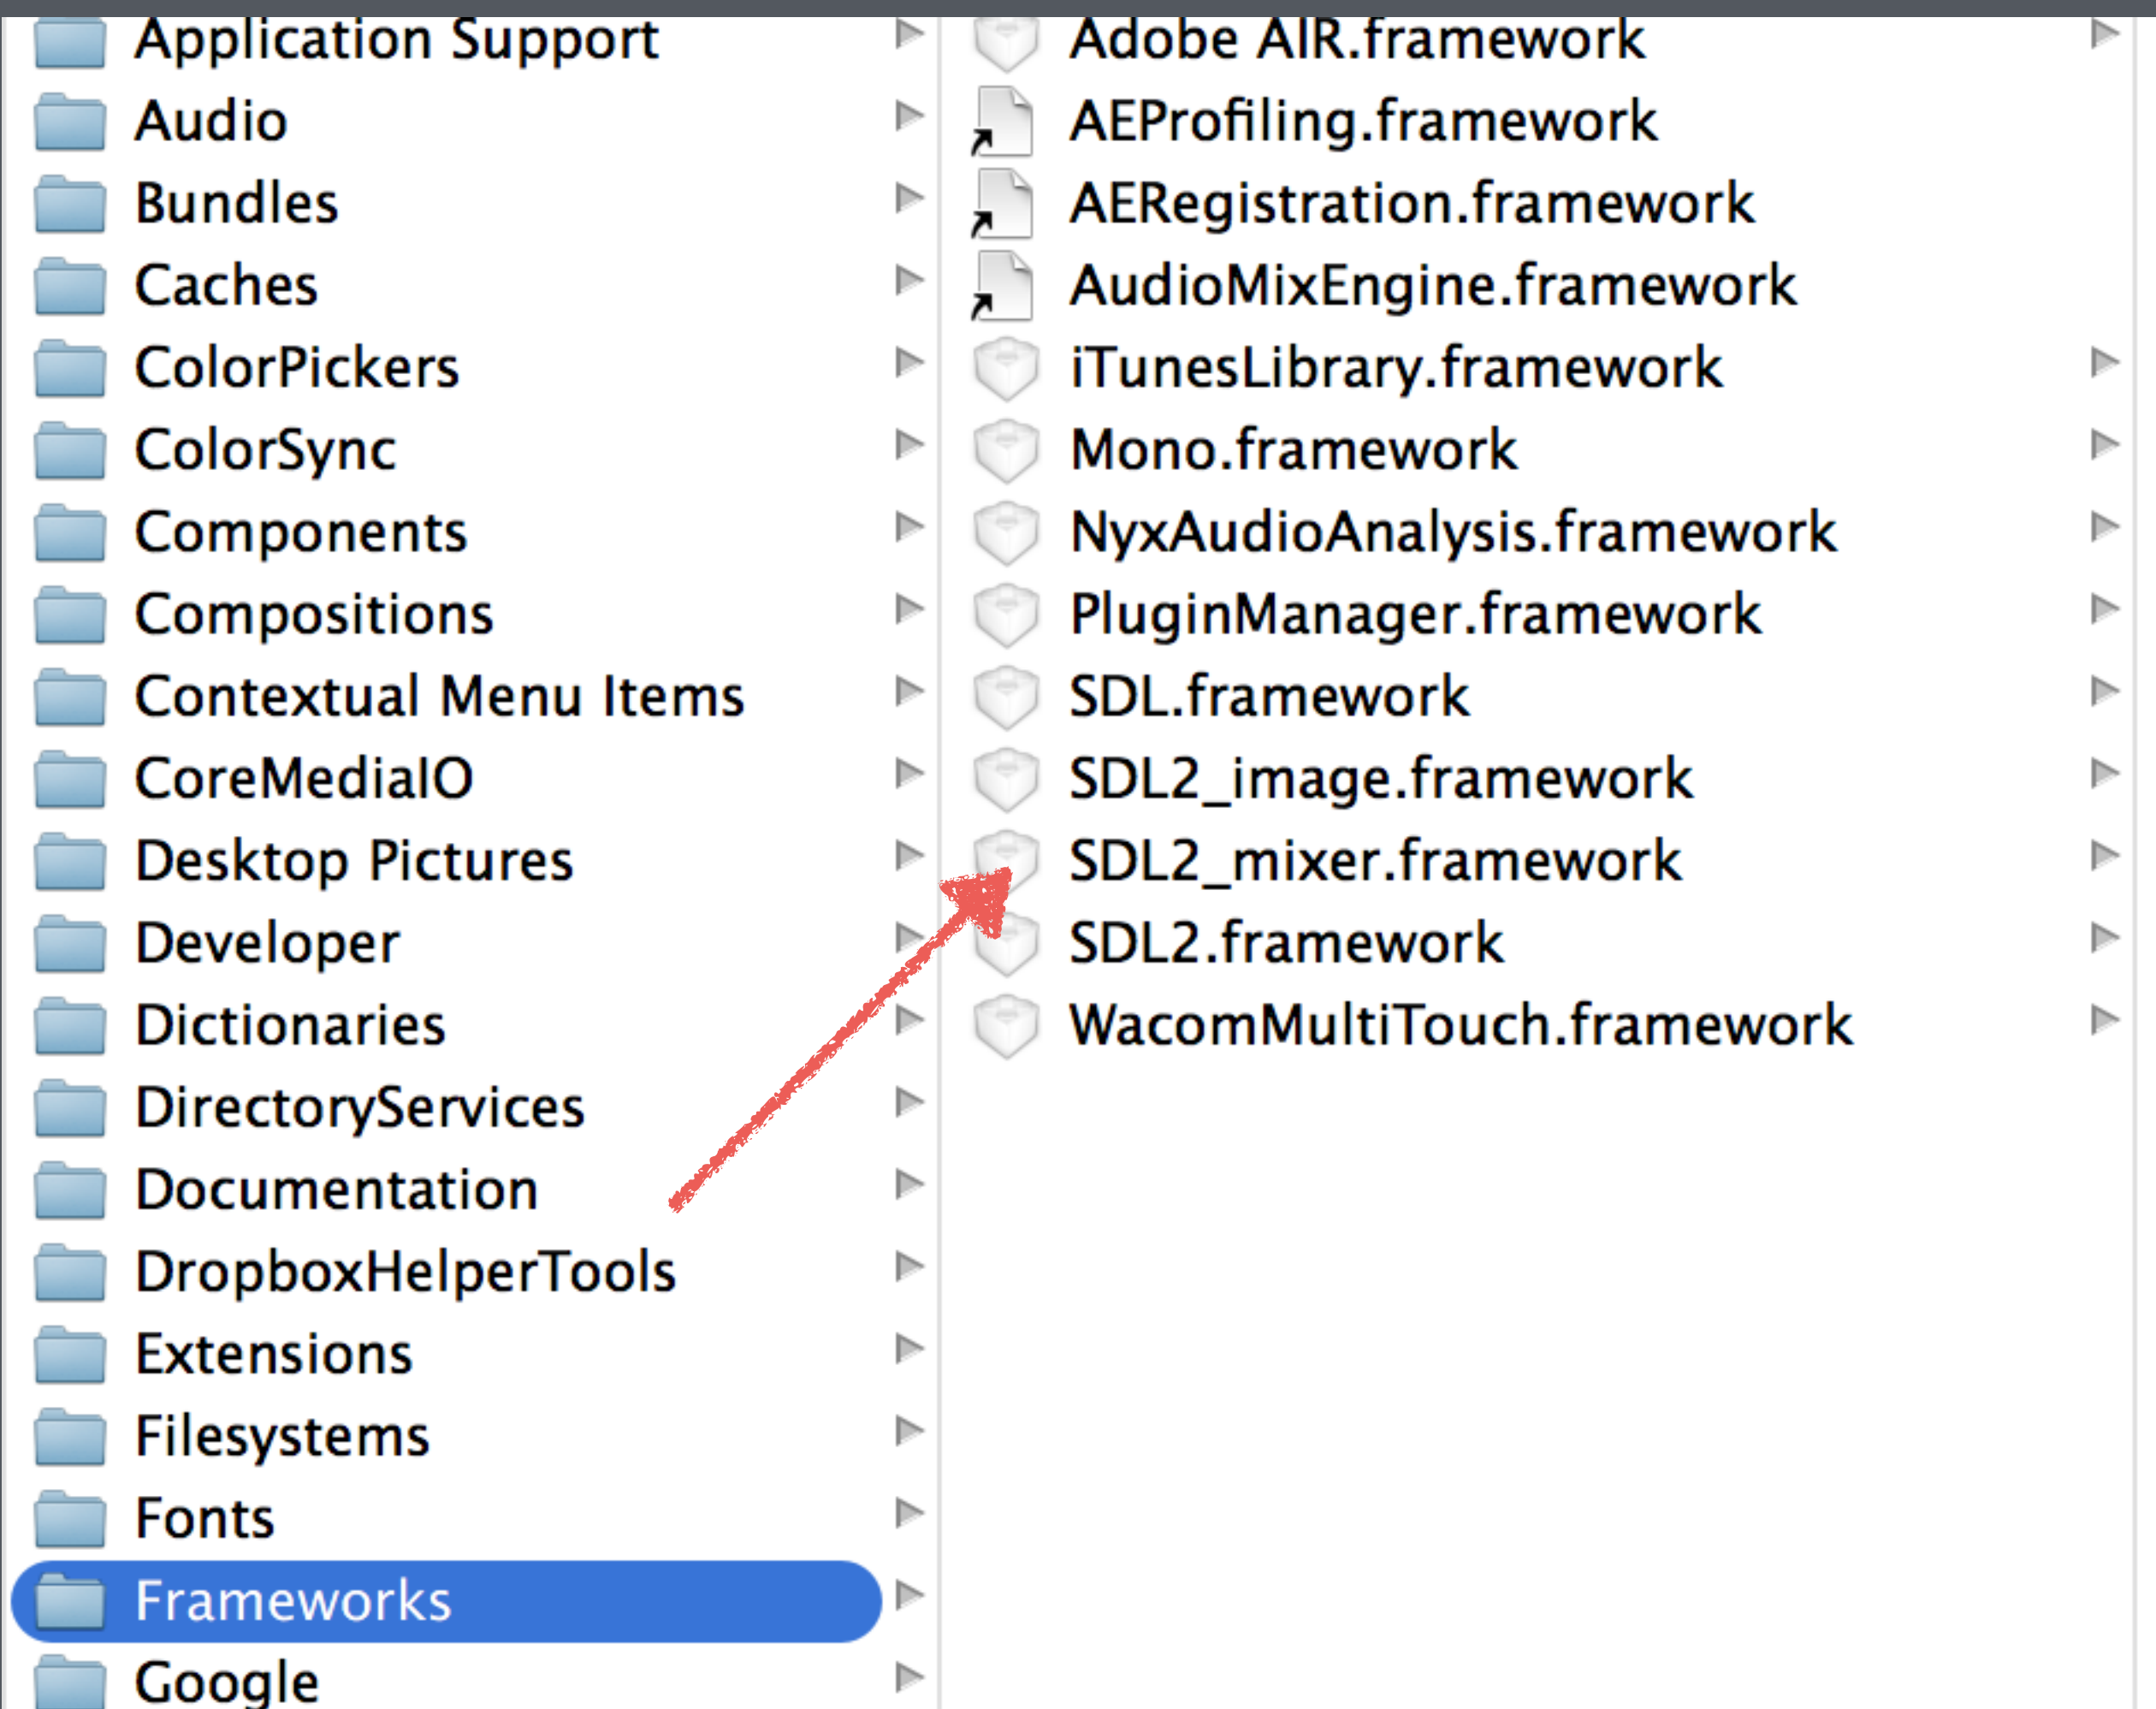

On **Mac**

RIGHT CLICK PROJECT

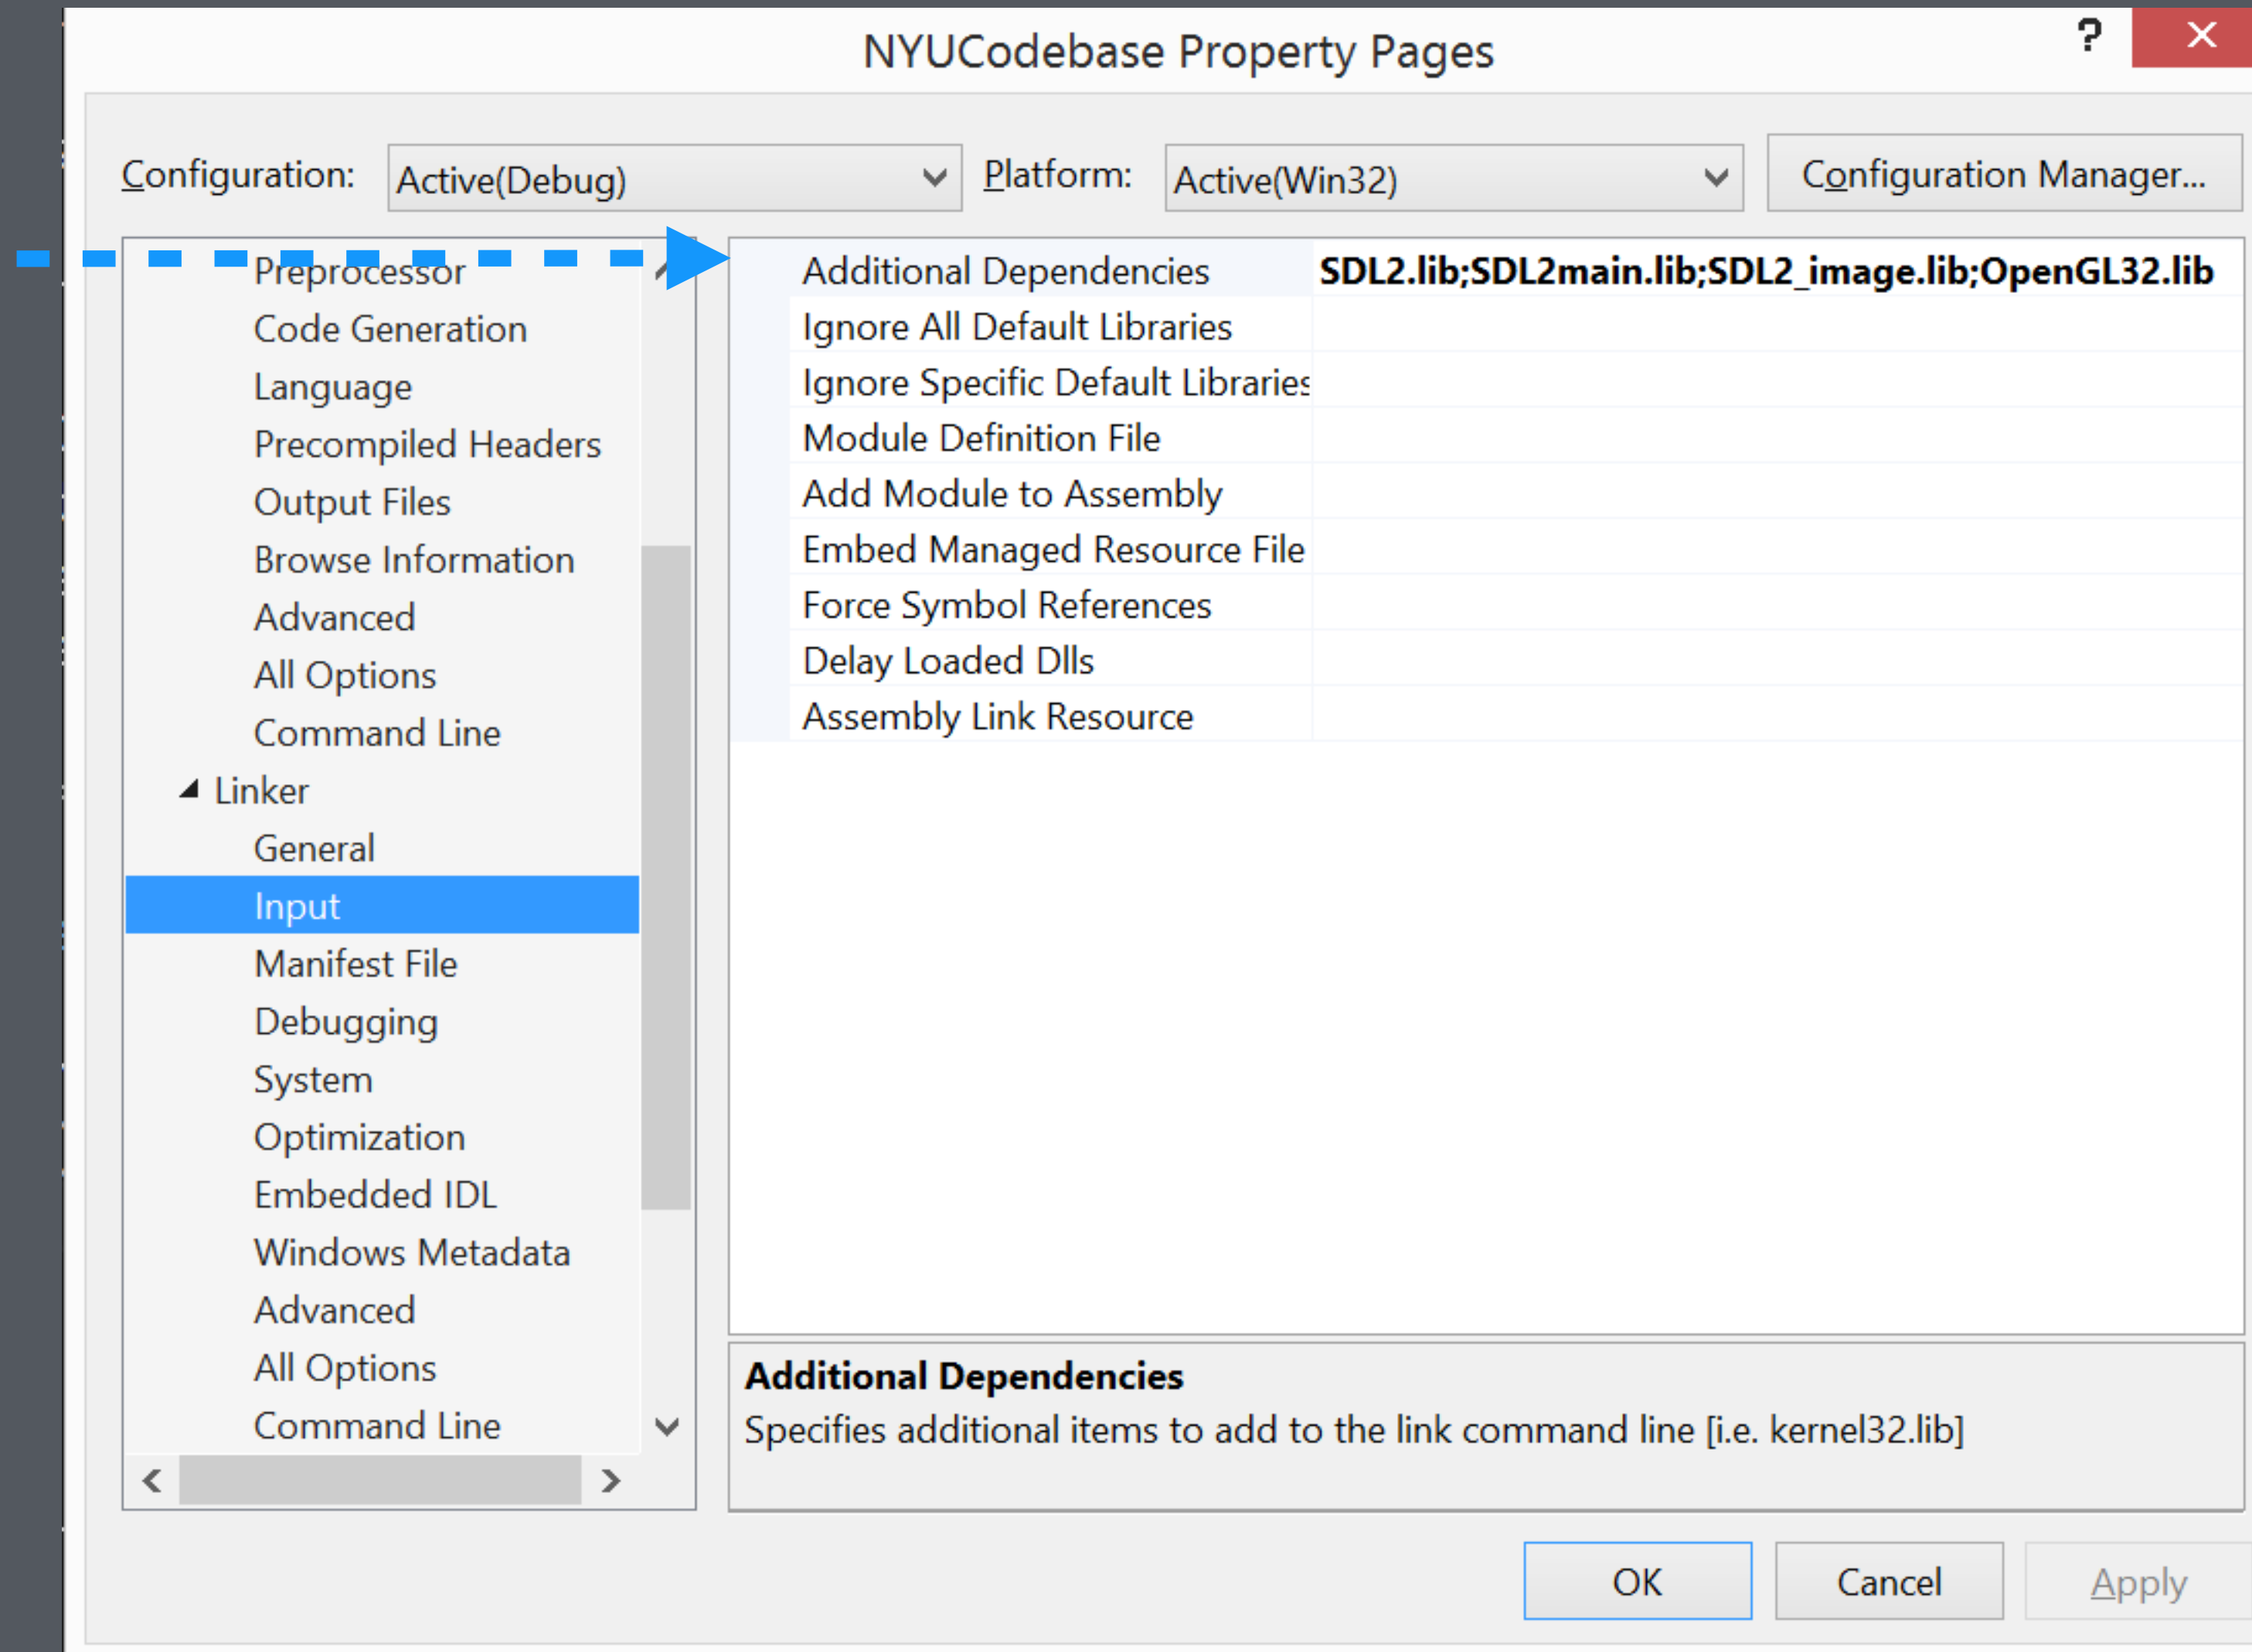

GO TO PROPERTIES

Add C:\SDL_mixer\include to additional library directories

ADD SDL2_mixer.lib to additional dependencies

Add C:\SDL_mixer\lib\x86 to additional library directories

Do the same thing for both Release and Debug configurations.

Copy all DLL files from C:\SDL_mixer\lib\x86 to where all the other DLL files are in your project.

Initializing **SDL_mixer**

Include **SDL_mixer** header.

```
#include <SDL_mixer.h>
```

```
int Mix_OpenAudio(int frequency, Uint16 format, int channels,  
int chunksize);
```

Initializes SDL_mixer with **frequency**, **format**, **channel** and **buffer size**.

```
Mix_OpenAudio( 44100, MIX_DEFAULT_FORMAT, 2, 4096 );
```

Loading and playing sounds.

Loading a sound.

```
Mix_Chunk *someSound;  
someSound = Mix_LoadWAV("some_sound.wav");
```

Playing a sound.

```
int Mix_PlayChannel(int channel, Mix_Chunk *chunk, int loops);
```

Plays a sound on specified channel. You can pass -1 for **channel** to use the first available channel. Loops can be **-1 to loop forever**.

```
Mix_PlayChannel( -1, someSound, 0);
```

Loading and playing **music**.

Loading music.

```
Mix_Music *music;  
music = Mix_LoadMUS( "music.mp3" );
```

Playing music.

```
int Mix_PlayMusic(Mix_Music *music, int loops);
```

Plays specified music. Loops can be -1 to loop forever.

```
Mix_PlayMusic(music, -1);
```

Additional useful functions.

Stopping music.

```
Mix_HaltMusic();
```

Setting volume.

```
Mix_VolumeMusic(30); // set music volume (from 0 to 128)
```

```
Mix_VolumeChunk(shootSound, 10); // set sound volume (from 0 to 128)
```

Stopping mixing on a channel.

```
Mix_HaltChannel(3); // stop playback on channel 3 (-1 to stop all sound)
```

Cleaning up.

Need to **clean up** music and sounds on quit.

```
DemoApp::~DemoApp() {  
  
    Mix_FreeChunk(someSound);  
    Mix_FreeMusic(music);  
  
    SDL_Quit();  
}
```

Pure **audio buffer** (the hard way).

Audio Buffer

Operating system audio mixer

Need to add **SDL_INIT_AUDIO** to **SDL_Init** flags.

```
SDL_Init(SDL_INIT_VIDEO | SDL_INIT_AUDIO);
```

Define your audio callback function.

```
void myAudioCallback(void *userdata, Uint8 *stream, int len) {  
}
```

Open an audio device with your callback and desired settings.

```
SDL_AudioSpec deviceSpec;  
deviceSpec.freq = 44100; // sampling rate (samples a second)  
deviceSpec.format = AUDIO_F32; // audio format  
deviceSpec.channels = 1; // how many channels (1 = mono, 2 = stereo)  
deviceSpec.samples = 512; // audio buffer size in samples (power of 2)  
deviceSpec.callback = myAudioCallback; // our callback function  
  
// open new audio device with our requested settings  
SDL_AudioDeviceID dev = SDL_OpenAudioDevice(NULL, 0, &deviceSpec, 0,  
SDL_AUDIO_ALLOW_FORMAT_CHANGE);  
SDL_PauseAudioDevice(dev, 0); // start playback on this device
```

The audio callback function will be **called by SDL every time it needs us to refill the audio buffer.**

Here is an example of an audio callback function that's generating a 440Hz tone at 44100 sample frequency in a one channel float buffer.

```
unsigned int numSamples = 0;

float getAudioForTime(long numSamples) {
    double elapsed = ((double)numSamples)/44100.0;
    return sin(elapsed * 2.0 * M_PI * 440.0);
}

void myAudioCallback(void *userdata, Uint8 *stream, int len) {
    for(int i=0; i < len/4; i++) {
        ((float*)stream)[i] = getAudioForTime(numSamples);
        numSamples++;
    }
}
```

Writing a simple **mixer**.

```
class MixerSound {
public:
    Uint32 offset;
    Uint32 length;
    Uint8 *buffer;
    float volume;
    SDL_AudioFormat format;
    bool loaded;
    bool playing;
    bool loop;
};

class DemoApp {
public:
    std::vector<MixerSound> mixSounds;
};
```

Create a **class** for storing
loaded **sound buffers**
and some basic **sound**
information.

Our app will keep these
in a **vector.**

```

int DemoApp::loadSound(const char *soundFile) {

    Uint8 *buffer;
    SDL_AudioSpec spec;
    Uint32 bufferSize;

    if(SDL_LoadWAV(soundFile, &spec, &buffer, &bufferSize) == NULL) {
        return -1;
    }

    SDL_AudioCVT cvt;
    SDL_BuildAudioCVT(&cvt, spec.format, spec.channels, spec.freq,
deviceSpec.format, deviceSpec.channels, deviceSpec.freq);
    cvt.len = bufferSize;
    cvt.buf = new Uint8[bufferSize * cvt.len_mult];
    memcpy(cvt.buf, buffer, bufferSize);

    SDL_ConvertAudio(&cvt);
    SDL_FreeWAV(buffer);

    MixerSound sound;
    sound.buffer = cvt.buf;
    sound.length = cvt.len_cvt;
    sound.loaded = true;
    sound.offset = 0;
    sound.format = deviceSpec.format;
    sound.volume = 1.0;
    sound.playing = false;
    mixerSounds.push_back(sound);

    return mixerSounds.size()-1;
}

```

SDL_LoadWAV can only
load **.wav** files.

```
someSound = loadSound("some_wave_file.wav");
```

```

float mixSamples(float A, float B) {
    if (A < 0 && B < 0 ) {
        return (A + B) - (A * B)/-1.0;
    } else if (A > 0 && B > 0 ) {
        return (A + B) - (A * B)/1.0;
    } else {
        return A + B;
    }
}

void DemoApp::appAudioCallback(void *userdata, Uint8 *stream, int len) {
    ClassDemoApp *app = (DemoApp*) userdata;
    memset(stream, 0, len);

    for(int i=0; i < app->mixerSounds.size(); i++) {
        MixerSound *sound = &app->mixerSounds[i];
        if(sound->loaded && sound->playing) {
            for(int s=0; s < len/4; s++) {
                float *sourceBuffer = (float*) (sound->buffer+sound->offset);
                ((float*)stream)[s] = mixSamples(((float*)stream)[s], (sourceBuffer[s] * sound->volume));
            }
            sound->offset += len;
            if(sound->offset >= sound->length-len) {
                if(sound->loop) {
                    sound->offset = 0;
                } else {
                    sound->playing = false;
                }
            }
        }
    }
}

deviceSpec.callback = DemoApp::appAudioCallback;
deviceSpec.userdata = (void*)this;

```

Playing a sound.

```
void DemoApp::playSound(int soundIndex, bool loop) {  
    if(soundIndex >= 0 && soundIndex < mixerSounds.size()) {  
        mixerSounds[soundIndex].playing = true;  
        mixerSounds[soundIndex].offset = 0;  
        mixerSounds[soundIndex].loop = loop;  
    }  
}
```

```
playSound(someSound, false);
```
